

The Blueprint of Intelligence Engine

Designing a Closed-Loop AI Architecture for Continental Europe FAM/PIAO Sales

Proof of Concept Architecture: Classical ML meets Generative AI

Future of RevOps

Static Data, Missed Signals

CRMs capture history, not opportunity. Billions in AUM and critical launch signals are buried in disconnected tables.

Active Intelligence

We don't just query data; we interpret it. By combining deterministic math with generative reasoning, we transform raw rows into targeted revenue campaigns.

ML Predicts Probability, LLM translates to Strategy

Who, How, Where?

Scope: A fully synthetic, end-to-end Proof of Concept modeling 150 accounts and 800+ opportunities across LU, NL, FR, and IT

	Phase 1: Targeting (The "Who")	Phase 2: Account Planning (The "How")	Phase 3: Whitespace (The "Where")
Primary Goal	Rank the universe	Map the specific account	Find systemic gaps
Core Data	Metrics & Opps	Contacts & Templates	Product Matrix & Catalog
ML/Analytics	XGBoost Propensity Model	Deterministic API Scoring	Multi-variable Heatmapping
LLM Output	Priority rationales	1-page briefs & call plans	Campaign messaging
Human Action	Override & recalibrate	Edit & execute	Launch regional campaigns

The Foundation

8 interlocking schemas mapping the complete reality of a FAM/PIAO account—from macro fund data to micro conference engagement.

Training & Triaging

```
{  
  'account_id': 'ACC_LU_0001',  
  'name': 'Lux PE Fund I SCSp',  
  'buy_upsell_propensity': 0.79,  
  'upcoming_launch_flag': true  
}
```

Key Insight: The Triage Agent doesn't just rank; it contextualizes. It isolates high-potential accounts like Lux PE Fund I before a launch date is missed.

The Foundation

Historical Weight (Win Rate + Avg Deal Size)

60%

Firmographics (Rev Concentration + Service Penetration)

80%

Timing Signals (Upcoming Launch Flag + Conference Engagement)

100%

Gradient Boosted Trees (XGBoost) calculate the baseline probability. The model dynamically weights non-linear signals- like a recent conference attendance (IQ-EQ Lux Funds Summit) paired with an upcoming fund launch - to flag immediate revenue opportunities.

**0.79: HIGH PROPENSITY
(Priority A)**

From Macro to Micro

Contact Intelligence

Anna Schmitz (Head of Ops) - High engagement score (0.85) .

Relationship Depth

5-year tenure, high service penetration in Fund Admin.

Product Fit

High potential revenue bucket for Middle Office.

Account Profile
Compiler

Targeting tells us Lux PE Fund I is a Priority A.
Account Planning tells us exactly what to say to them.

Managing Guardrails

The Persona:
Establishes
role and
boundaries.

System: You are an account planning assistant for IQ-EQ
Continental Europe sales...

...Structure it as: 1) Summary, 2) Relationship, 3)
Whitespace, 4) Contacts, 5) Actions.

The Constraint:
Forces strict
structural
compliance;
prevents
hallucination.

User: Here is the JSON data for ACC_LU_0001: [JSON
payload]

The Data Injection:
Restricts LLM to reasoning **ONLY** over pre-computed,
approved ML scores.

By isolating the mathematical scoring from the linguistic reasoning, we ensure zero hallucination of financial metrics.

Account Planning Priority Index

Account Planning Priority Index as a factor of

- Buy Propensity
- Total Whitespace Potential
- Strategic Flag

Key Insight:

The Co-Pilot automates the blank-page problem. It synthesizes structured metrics and whitespace logic into an actionable, CRM-ready brief in seconds.

Target: Anna Schmitz.

Focus: Cross-sell Middle Office.

Rationale: High trading volume fund preparing for T+1.

Whitespace Analysis

[Fund Size = High]

+

[Asset Class = PE]

+

[Has_Middle_Office = FALSE]

Triggers: High Priority Whitespace

Phase 3 reverses the lens.

Instead of asking "What should we sell to this account?", we ask "Which accounts are missing this critical service?"

Summarise whitespace across NL PE funds and suggest a Q3 campaign targeting accounts with no middle office.

Whitespace Heatmap

Identified Cluster:
High trading volume LU funds completely missing T+1 Middle Office services.

Total Pipeline Potential:
€1.5M.

Human-in-the-loop

AI accelerates the analysis; humans own the relationship.

1. Threshold Tuning

Sales ops adjust what counts as "high potential" (e.g., shifting the AUM minimums) before regenerating views.

2. Override Logging

If a rep flags a 'High Propensity' score as incorrect, the system logs the manual override to recalibrate the baseline model.

3. Action Validation

'Next-Best Actions' generated by LLM are suggestions, queued for human approval before CRM injection.

Algoleap's RevOps AI Engine Demo

**Not a collection of tools.
A self-reinforcing revenue engine.**
